Food Dehydration: Practices and applications Wallace B. Van Arsdel 1973 Abstract: A comprehensive review of the principles and applications of food dehydration technology is presented to promote an understanding of the mechanisms of the drying processes and to encourage practical developments in the field. Volume 1 provides information on the physical and thermal properties of foods undergoing dehydration; the phenomena of heat and mass transfer in food, water, and air are described. The history and current status of the food dehydration industry are discussed. Kinds of drying equipment used (air, drum, and freeze dryers) and characteristics of dehydration plant operations are evaluated.

Volume 2 describes the commercial dehydration of specific food commodities: potatoes, vegetables, fruits, milk, meat, eggs, juices, cereal grains, fish products, coffee and tea, soup and other dry mixes, and intermediate moisture foods. (nm).

Challenges of the Unseen World Richard J. Meyer 2020-08-06 Solving real-world health challenges in a learning environment You are at an exciting gateway into the world of microorganisms. With nothing more than basic lab equipment such as microscopes, Petri dishes, media, and a handful of reagents, you will learn to isolate, grow, and identify bacteria that live all around us. This is no ordinary microbiology laboratory course; not only will you learn how to streak plates, use a microscope, perform a Gram stain, and prepare serial dilutions and spread plates—fundamental skills found in every microbiologist's toolkit—you will solve a series of public health–related challenges that many professional microbiologists encounter in their work. By the end of this course, you will: Determine the origin of a nosocomial infection. Using foundational and molecular methods, you will determine whether the infections occurring in hospitalized patients are the result of contaminated medical items. Select the antibiotic to treat a patient with Crohn's disease. You will find minimum inhibitory concentrations of various antibiotics for a *Pseudomonas* strain associated with Crohn's disease. Pinpoint the source of lettuce contaminated with *E. coli*. Using molecular tools you will investigate a common food safety challenge, antibiotic-resistant *E. coli* and the potential for spread of this resistance in the environment. Find the farm releasing pathogens into a stream used for drinking water. Using bacteriophage load in water samples, you will locate the source of fecal contamination in the water supply of a village in an underdeveloped country. Evaluate the potential of bacteria to cause a urinary tract infection. You will test for biofilms, quorum sensing behavior, and chemotaxis and assess which disinfectants would be most effective for sanitizing contaminated surfaces. Microbiology educators and researchers Richard Meyer and Stacie Brown have created this hands-on, engaging introduction to the essential laboratory skills in the microbial sciences that is sure to change the way you view the world around you.
